POLY-MART 250 GALLON RAIN HARVESTING TANK

Poly-Mart offers a line of Rain Harvesting Tanks in various sizes as well as eight different colors. Rain Harvesting is the catchment and storing of rainwater for use at a later date. The reasons for collecting rainwater are vast and depend on your specific needs. Rainwater collected from roofs of houses can make an important contribution to the general availability of water as well as household water cost savings. Average U.S. households during Spring & Summer months use 60% of their monthly water usage on watering their lawns, plants & gardens. As water costs rise, collecting rainwater has become more popular and a bigger part of the American culture. In addition to water cost savings, Americans are choosing to collect rainwater so they can contribute to something that provides a net positive impact on the environment while still having the freedom to water their lawn despite the growing amount of city watering restrictions throughout the country. Whether your preference is one or all of these, Poly-Mart designed a line of tanks with all of the fittings needed to start collecting the rain! Our Rain Harvesting Tanks come with a Stainless Steel Strainer Basket for keeping out large debris from entering the tank as well as a Screened Overflow Assembly for ease in directing overflown water while keeping out pests & mosquitoes. We also install a 3/4" bulkhead fitting so you can easily install a Water Hose Spigot. Our 3/4" Bulkhead fitting is placed at a height that enables you to fit a watering can underneath the spigot for filling.
