

# Liquid Level Control Box

### Pump Up, Pump Down Control

The water level control box is a simple, cost effective control for applications when the water level is variable. The Munro water level control provides pilot duty operation when thermal overload protection is present, for example, submersible water feature pumps or dewatering pumps. Used any place power can be interrupted, this control transforms all outbound voltage to a low, safe, 24v. Low external voltage is especially important when external sensors or switches are used, such as the float switch included with this control box.

### CONSTRUCTION

- Dimensions – 12"x12"x6"
- UL and CUL listed relay
- UL-50 Type 3R listed enclosure – approved for outdoor use, available in stainless steel or powder coated blue
